Art Unit: 1625

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

The specification is objected to under 35 U.S.C. 112, first paragraph, as the nature of the pharmaceutical arts is such that screening in vitro and in vivo is needed to determine which compounds exhibit the desired activities. There is no absolute predictability which compounds exhibit the desired activities. There is no absolute predictability in this art. The application discloses use as assays.

Reaction conditions/precursors for these compounds are not set forth in the disclosure. There is insufficient disclosure in the specification to enable one of ordinary skill in the art to replace various substituents and still expect the alleged anti-viral activity. Particularly in view of the recognized unpredictability in the pharmaceutical art.

The specification does not give any guidance as to the full range of conditions, which could be treated or prevented using the instant claimed process. In In re Wands, 8 USPQ2d 1400 (1988), factors to be considered in determining whether a disclosure meets the enablement requirement of 35 U.S.C. § 112, first paragraph, have been described. They are:

1. the nature of the invention,
2. the state of the prior art,
3. the predictability or lack thereof in the art,

Art Unit: 1625

4. the amount of direction or guidance present,
5. the presence or absence of working examples,
6. the breadth of the claims,
7. the quantity of experimentation needed, and
8. the level of the skill in the art.

In the instant case, Applicants are claiming a method of prevention, for example, ~~subarachnoid hemorrhage~~, ~~Parkinson's disease~~, ~~Alzheimer's disease~~ or AIDS. The nature of the pharmaceutical arts is that it involves screening in vitro and in vivo to determine which compounds exhibit the desired pharmacological activities. There is no absolute predictability even in view of the seemingly high level of skill in the art. The existence of these obstacles establishes that the contemporary knowledge in the art would prevent one of ordinary skill in the art from accepting any therapeutic regimen on its face. The instant specification does not give any guidance's as to the full range of conditions, which could be treated or prevented using the instant claimed process. In order to practice the claimed invention, one skilled in the art would have speculate which conditions could be prevented using the claimed process. In order to practice the claimed invention, one skilled in the art would have speculate which conditions could be prevented using the claimed benzamide derivatives found in the instant claims. The number of possible conditions embraced by the claims would impose under experimentation on the skilled art worker. Therefore, the broad terminology

"treatment or prevention" is not enabled because the metes and bounds of conditions, which could be treated or prevented, cannot be ascertained.

Claims 1-8 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. Claims refer to a in vivo method to treating a patent with a tumor as noted above the specification lacks <sup>sufficient</sup> ~~stuffed~~ enablement to support this claim. In addition the Soga 132 Declaration has been noted and consideration but is not deemed persuasive of patentability because it too is not an in vivo showing.

No claim is allowed.
